MCP (Model Context Protocol)

→ MCP is an open-source standard for connecting AI applications to external systems.

→ Using MCP, AI applications like Claude or ChatGPT can connect to data source (e.g. local files, DB), tools (e.g. search engines) & workflows (e.g. specialized prompts) - enabling them to access key info. and perform tasks.

→ Think of MCP like USB-C port for AI app^n. Just as USB-C provides a standardized way to connect electronic devices, MCP provides a standardized way to connect AI app^n to external systems.

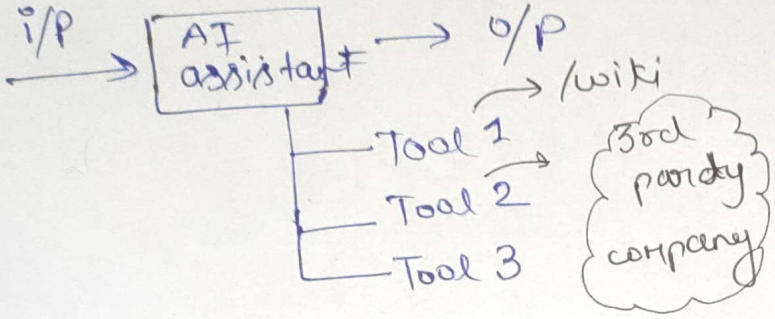

⇒ Idea behind protocol:

we will get response in form of JSON (using REST APIs)

⊨ Gen AI & Agentic AI applications: (happening ?)

Generative AI

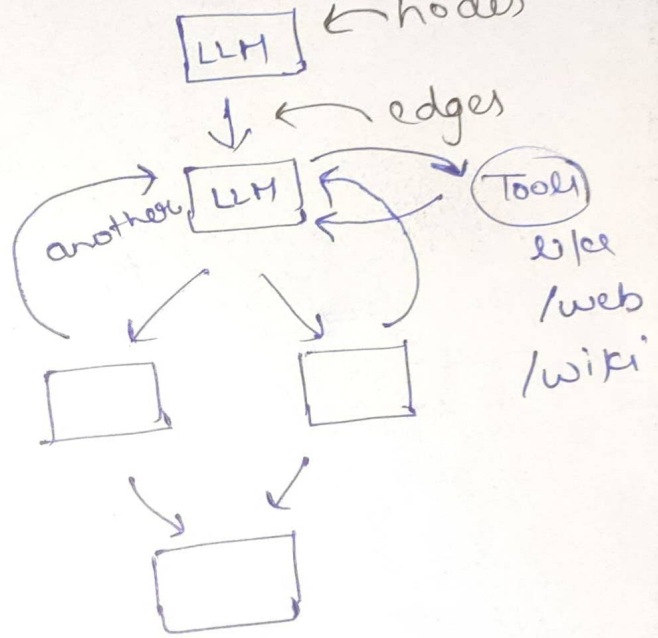

- whenever 3rd party company like arxiv, wiki, tavily, vectorDB ⇒ give their response — we have to update the code.

Agentic AI

→ Stateful AI agents (1st day using LangGraph)

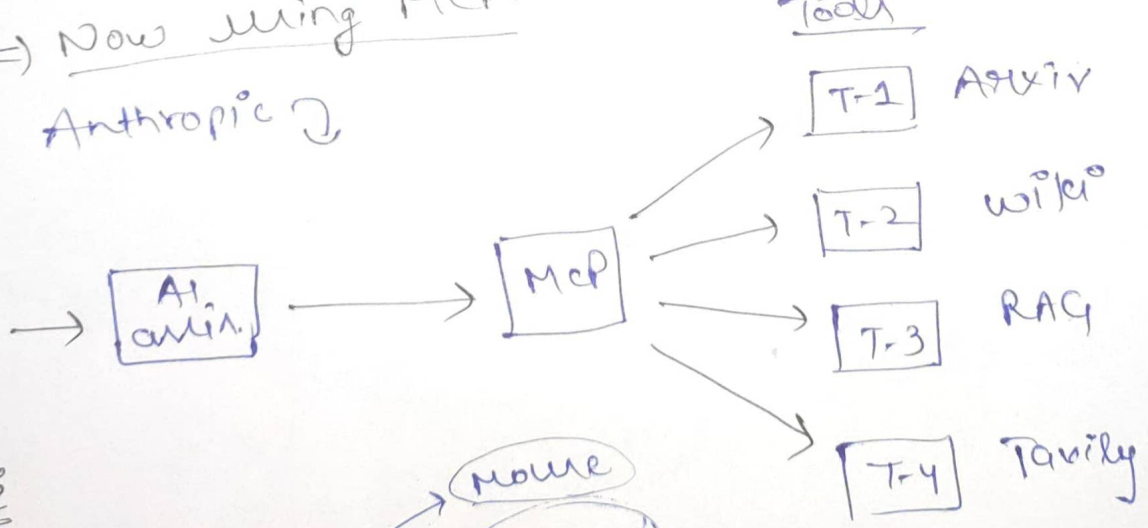

→ solving complex workflow

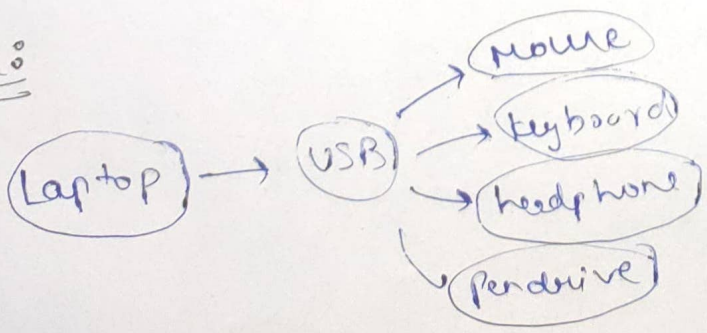

→ every node behave like an AI agent

- ⊨ Now using MCP:

Anthropic ↴

ex:

these tool managed by the {service providers} (so we do not need to make any changes in client end)
