* Routing
* Fallbacks
* Caching
* Rate limiting
* Guardrails
* Cost TRACKING
LLM Provider
OpenAI
Google
Anthropic
GROQ
CORE Capabilities

Core Capabilities

- **Unified API & Abstraction:** Provides a single, standardized format (often compatible with OpenAI's API structure) to call hundreds of models from different providers like OpenAI, Anthropic, Google, and AWS Bedrock without rewriting code. AWS in Plain English +1
- **Automatic Fallbacks & Failover:** Reroutes traffic automatically to a backup model or provider if the primary service experiences outages, high latency, or rate-limit errors. OpenRouter +1
- **Smart & Dynamic Routing:** Directs specific prompts to the most suitable or cost-effective model depending on the task (such as sending simple queries to smaller, cheaper models and complex reasoning to larger ones). YouTube · DSwithBappy +1
- **Load Balancing:** Spreads requests across multiple API keys, endpoints, or models to prevent any single provider from overloading or hitting hard rate limits. YouTube · Krish Naik +1
- **Response Caching:** Stores and reuses answers for repeated or similar questions (using tools like Redis or semantic caching), which can cut token costs by 40% to 60%. Institute of AI Product ... +1
- **Observability & Analytics:** Logs every prompt, response, token count, latency metric, and dollar spent, with native integrations for platforms like LangSmith or Langfuse. You can explore centralized tracking via the LangSmith LLM Gateway.
- **Security & Guardrails:** Intercepts requests and responses to scrub sensitive data (like credit card or identity numbers) and block prompt injections or toxic content before it reaches the model. Truefoundry +1
- **Rate Limiting & Budget Governance:** Enforces strict financial spend caps and rate limits at the user, team, project, or virtual-key level. Maxim AI +1
